

MCQs on Python Internal Working

1. Python is mainly an _____ language.

- A) Compiled
- B) Interpreted
- C) Assembly
- D) Machine

2. Which program converts Python code into bytecode?

- A) Loader
- B) Compiler
- C) Interpreter
- D) Assembler

3. Python source code is first converted into:

- A) Machine code
- B) Assembly code
- C) Bytecode
- D) Binary file

4. Bytecode in Python is stored in:

- A) `.exe` files
- B) `.class` files
- C) `.pyc` files
- D) `.html` files

5. Which component executes Python bytecode?

- A) CPU
- B) PVM
- C) RAM
- D) BIOS

6. PVM stands for:

- A) Python Variable Machine
- B) Program Virtual Machine
- C) Python Virtual Machine
- D) Python Visual Machine

7. What is the correct flow of Python execution?

- A) Source Code → Machine Code → Bytecode
- B) Source Code → Bytecode → PVM
- C) Source Code → PVM → Compiler
- D) Bytecode → Source Code → PVM

8. Which file contains Python source code?

- A) `.py``
- B) `.pyc``
- C) `.ppt``
- D) `.exe``

9. Python is platform independent because:

- A) It uses machine code directly
- B) Bytecode can run on any system with PVM
- C) It uses only Windows
- D) It avoids compilation

10. Which of the following creates bytecode?

- A) Linker
- B) PVM
- C) Python Compiler

D) Operating System

11. Python Virtual Machine is responsible for:

- A) Writing source code
- B) Executing bytecode
- C) Creating hardware
- D) Storing variables permanently

12. Bytecode is:

- A) Human-readable code
- B) Low-level intermediate code
- C) Pure machine code
- D) Hardware language

13. Which directory usually stores `.pyc` files?

- A) `system32`
- B) `bin`
- C) `__pycache__`
- D) `temp`

14. What happens after Python source code is compiled?

- A) Program ends immediately
- B) Bytecode is generated
- C) Hardware is initialized
- D) RAM is cleared

15. Python execution is slower than C because:

- A) Python uses too much RAM
- B) Python is interpreted through PVM

- C) Python has no compiler
- D) Python cannot use loops

16. Which of these is NOT part of Python internal working?

- A) Source Code
- B) Bytecode
- C) PVM
- D) HTML Parser

17. The Python compiler translates source code into:

- A) Binary language
- B) Assembly language
- C) Bytecode
- D) HTML

18. The `.pyc` file helps in:

- A) Faster execution
- B) Slower execution
- C) Printing output
- D) Taking input

19. Which statement is TRUE about Python?

- A) Python directly executes source code without conversion
- B) Python converts code into bytecode before execution
- C) Python only works on Linux
- D) Python cannot create executable files

20. Which of the following correctly explains Python working?

- A) Source Code → Compiler → Bytecode → PVM → Output

- B) Source Code → Output → Compiler
- C) PVM → Source Code → Bytecode
- D) Compiler → PVM → Source Code
